

Composting & Grasscycling

Composting is Easy

Composting is a natural process in which micro-organisms decay organic material such as leaves, paper, napkins and food waste into a soil like material.

Benefits of Composting

- Keeps organic wastes out of landfills
- Provides nutrients to the soil
- Reduces the need for fertilizers and pesticides
- Protects soils from erosion
- Prevents pollution

If you don't already compost, try it! It's great fun and you will be participating in a recycling program that is helping to create a better future for us all!

Grasscycling

What is grasscycling?

Grasscycling is the natural recycling of grass by leaving clippings on the lawn when mowing. Grass clippings will quickly decompose, returning valuable nutrients to the soil.

Benefits of Grasscycling

- Saves time, money, and protects the environment
- Reduces mowing time
- Adds beneficial organic matter to the soil
- Provides free fertilizer for your lawn
- Produces healthy, green lawns
- Minimizes toxic runoff entering storm drains and polluting lakes, creeks, and rivers
- Reduces the amount of yard waste disposed in landfills
